

Typesider QA Assignment

Name: Akanksha Das

1. Testing Overview

Application	Typesider Windows application
Testing approach	Functional, UI/validation, workflow, reward, persistence, background-behavior and edge-case testing
Environment	Windows 11 desktop; Google Chrome
Test data	Dedicated test accounts and non-production test inputs; Email, Password
Scope	Onboarding, profile, social links, TyZaps, Insights, streaks, reward eligibility, reward cards, redemption, Collections and FAQ

2. Areas Requested / Attention Areas

1. Streaks and streak calendar: Tested – daily goal, calendar status, life usage, reward-day status and persistence.
2. Reward days and eligibility: Tested – 5,000 TyZaps goal, life/streak protection, reward availability and claim window.
3. Free gift-card rewards: Tested – reward details, Typoint cost and reward availability.
4. Reward cards and partner brands: Tested – partner reward/product listings and selection.
5. Reward claim/redemption flow: Tested up to mobile-number/OTP verification; actual OTP/gift-card delivery was not completed.
6. Onboarding and user journey: Tested – sign-in, profile completion, social links, DOB, rewards and navigation.
7. Background behavior: Tested – TyZaps continued to be tracked while the app was minimized/backgrounded and after reopening.
8. Potential issues and edge cases: Tested – invalid DOB, social-link validation, balance synchronization, broken FAQ navigation and LinkedIn persistence.

3. Functional Areas That Worked as Expected

1. Insights ON increased TyZaps; turning Insights OFF stopped TyZaps from increasing.
2. TyZaps continued to be tracked while the application was in the background and after reopening.
3. Today's Typoints generally reflected the TyZaps earned according to the displayed conversion rule.
4. The streak calendar displayed reward/life information and the observed Life Used behavior was consistent with the application's stated rules.
5. Reward progress and reward-day information were displayed in the calendar.
6. An available reward remained available after closing and reopening the application.
7. Mobile-number client-side validation rejected alphabetic input and fewer than 10 digits; a 10-digit value enabled the OTP action.
8. After redeeming a reward/product, the Typoints balance decreased and the redeemed item appeared in Collections.

4. Defects / Issues Found

BUG-001 – Application accepts and persists an invalid/underage Date of Birth

Steps to reproduce:

1. Create or open a test account and navigate to the profile/application form.
2. Enter an invalid adult eligibility date, for example 28/09/2025 (and separately a future date during profile testing).
3. Save/continue the profile.
4. Log out and log back in.
5. Open the profile and verify the Date of Birth.

Expected result: The application should validate the Date of Birth against the stated 18+ eligibility requirement, reject an underage/future date, and prevent invalid data from being saved.

Actual result: The application accepted the invalid date and allowed it to be saved. The invalid DOB was also observed as persisted after re-login.

Severity: High

Priority: High

BUG-002 – Social-media link field accepts and saves invalid input

Steps to reproduce:

1. Open the profile/application form and navigate to Social Links .
2. Enter an invalid Instagram value such as 'abc123!!!' rather than a valid profile URL .
3. Save/continue the profile.
4. Reopen the profile and check the social link.

Expected result: The field should validate the URL/profile format and display a validation message for invalid input.

Actual result: The invalid Instagram value was accepted and saved successfully.

Severity: Medium

Priority: Medium

[illegible]

BUG-003 – Overall Typoint balance does not synchronize immediately

Steps to reproduce:

1. Record the Overall Typoints balance and Today's Typoints.
2. Earn additional TyZaps while Insights are enabled.
3. Observe Today's Typoints and the Overall Typoints balance without navigating away.
4. Navigate to another section and return to the dashboard.

Expected result: The overall Typoint balance should update automatically when new Typoints are earned.

Actual result: Today's Typoints increased while the overall balance remained stale. The overall balance updated only after navigation/activity in the tested cases.

Severity: Low

Priority: Medium

BUG-004 – Read FAQ link opens a Page Not Found screen

Steps to reproduce:

1. Open the Streak Calendar/Rewards area.
2. Select the information icon for a date.
3. Select 'Read FAQ'.
4. Observe the destination page.

Expected result: The FAQ page containing the relevant streak/reward information should open successfully.

Actual result: The link opens a 'Page Not Found' page. The issue was reproduced from multiple date information screens.

Severity: Medium

Priority: Medium

**BUG-005 – LinkedIn profile field/link is not displayed or retained after onboarding****Steps to reproduce:**

1. Create a fresh test account.
2. During profile/application setup, enter a LinkedIn profile link.
3. Complete and save the profile.
4. Log out and log back in.
5. Open the profile/social-links section and check LinkedIn.

Expected result: The LinkedIn field should be available and the previously entered LinkedIn profile information should be retained and displayed.

Actual result: After re-login, the LinkedIn section did not display the entered LinkedIn profile information/input as expected. The behavior was reproduced with a second test account.

Severity: Medium

Priority: Medium

5. Reward & Redemption Testing Details

- The reward journey was tested even where no defect was found, because it was a key area in the requested scope.
- **Reward eligibility:** Verified the 5,000 TyZaps daily goal, reward-day progress, life/streak behavior and reward availability.
- **Reward details:** Verified the reward card, Typoint balance/cost and claim-window information.
- **Redemption:** Selected a reward/product, proceeded through redemption, observed the Typoint deduction and verified the item in Collections.
- **OTP stage:** Reached the mobile-number verification step and tested input validation. The actual OTP verification and final gift-card delivery were not completed.
- **Collections:** Verified that the redeemed item appeared in Collections after redemption.

6. Edge Cases Considered

- Empty required fields during sign-in/profile submission.
- Underage and future Date of Birth values.
- Invalid social-media URL/text input.
- Password values at the stated length boundary; no special-character requirement was assumed where none was displayed.
- Phone input containing letters, fewer than 10 digits, and a 10-digit value.
- Application minimized/backgrounded and reopened.
- Reward persistence after application restart.

- Delayed balance refresh between Today's Typoints and Overall Typoints.
- FAQ navigation from multiple date-information screens.
- Profile persistence using a second test account.

7. Limitations

- The final OTP verification and actual gift-card delivery were not completed because they require a phone-number verification step.
- The referral-code behavior was observed but was not reported as a defect because the entered code may have been a valid referral code; therefore no unsupported claim was made.
- Only reproducible/observed issues have been listed as defects.

Conclusion

The testing covered the main user journey requested for Typesider, from onboarding and profile setup through TyZaps, streaks, rewards, redemption and Collections. The core reward and streak behaviors observed during testing generally worked as expected. Five issues were identified and documented, including Date of Birth validation/persistence, social-link validation, Typoint balance synchronization, broken FAQ navigation and LinkedIn profile persistence/display. The defects were prioritized based on their observed user impact and reproducibility. Overall, the testing focused on realistic user behavior, boundary conditions and persistence rather than only happy-path testing.
